

SynTurf Installation

Technical SEO Remediation Plan

What to fix first to improve crawlability, ranking, local/entity confidence, Google Search visibility and AI retrieval.

Website: www.synturfinstallation.com | Audit date: September 5, 2026

Executive conclusion

The site's positioning is improving, but the technical foundation is not finished. The highest-value work is cleanup and consolidation - not adding dozens of new pages. Fix crawlable content, duplicate URLs, 404s, redirects, NAP consistency, canonicals and internal linking before aggressively scaling backlinks or content.

0 broken internal links target	0 important 404s target	1 canonical business entity
-----------------------------------	----------------------------	--------------------------------

Prepared as an implementation-focused audit. Verify final status in Google Search Console, server logs, sitemap and live HTTP responses after fixes deploy.

Critical technical fixes

These are the issues most likely to waste authority, confuse crawlers or suppress the value of otherwise strong content.

1 Make every money page fully crawlable in HTML

Several service pages expose very little substantive content to crawlers compared with what the site is trying to communicate visually.

Fix: Server-render/static-render the primary page content. In Google Search Console, inspect the rendered/crawled HTML for Residential, Commercial, Rooftop, Balcony, Putting Green, Concrete, Projects, Resources and location pages.

2 Remove the duplicate balcony/rooftop homepage copy

`/balcony-rooftop-design-houston/` is effectively competing with the homepage instead of owning a distinct search intent.

Fix: Either 301 it to the best existing rooftop/balcony hub or rebuild it as a truly unique design/inspiration page. Do not keep a homepage duplicate indexed.

3 Correct broken or misdirected internal service links

Rooftop and Balcony navigation/internal links should point to their dedicated authority URLs, not a generic combined page.

Fix: Rooftop links -> `/rooftop-artificial-turf-installation/`. Balcony links -> `/balcony-artificial-turf-installation/`. Run a full internal-link crawl after deployment.

4 Eliminate valuable 404s and soft 404s

Legacy paths such as `/install` and inconsistent variants such as `/warranty` can create crawl waste or lost authority if linked or indexed.

Fix: Export all 404s from Search Console and server logs. Redirect only when a close replacement exists. Leave truly irrelevant dead URLs as 404/410 rather than sending everything to Home.

5 Standardize trailing slash behavior

A URL such as `/warranty` should not behave differently from `/warranty/`.

Fix: Choose one convention sitewide, then enforce it with one-hop 301 redirects. Use the same format in canonicals, sitemap, navigation and internal links.

6 Retire legacy service URLs cleanly

Old pages such as `/repair` and `/putting-greens` carry obsolete positioning and conflicting warranty language.

Fix: 301 `/putting-greens` -> `/putting-green-installation/`. Move repair intent to the correct SynTurf Care destination or retire it. Remove obsolete URLs from the sitemap and internal links.

7 Fix NAP inconsistency across the web

Old addresses, old phone numbers and legacy brand naming weaken local/entity confidence.

Fix: Standardize the exact business name, address, phone, URL and primary category across the website, Google Business Profile and major citations.

8 Force one domain version

Both www and non-www variants can create unnecessary canonical ambiguity.

Fix: Make <https://www.synturfinstallation.com/> the single canonical host. HTTP and non-www versions should 301 directly to the final HTTPS/www equivalent in one hop.

PRIORITY 2

Authority, indexation and entity fixes

9 Clean old external citations and legacy entity references

Third-party listings that still show old company/address/phone information can conflict with the current entity.

Fix: Audit Google, Bing, Apple Maps, Yelp, Nextdoor, Facebook, BBB, Houzz, Angi, BuildZoom, MapQuest, YellowPages and major data aggregators. Correct or suppress duplicates.

10 Rewrite outdated Contact and 404 messaging

Legacy cleaning/repair/playground language muddies the Installation brand.

Fix: Contact and 404 pages should reinforce installation: residential, commercial, rooftop, balcony, putting green, pet, concrete and service areas.

11 Strengthen location pages - do not mass-produce doorway pages

Thin city pages create little local authority and can become repetitive.

Fix: Prioritize revenue markets. Add real project proof, neighborhoods, drainage/soil considerations, pricing factors, photos, FAQs and internal links. Fewer strong pages beat dozens of weak city swaps.

12 Turn Projects into first-party case studies

A gallery alone does not capture the SEO/AI value of work SynTurf has actually completed.

Fix: Each major project gets a crawlable case study with city, property type, square footage, existing condition, drainage, installation method, product/materials, duration, result and original images.

13 Build Commercial as a dedicated acquisition silo

Commercial buyers have different problems and search language than homeowners.

Fix: Build a strong Commercial hub, then deep pages for multifamily/apartments, HOAs, hotels, restaurants/bars, daycare/playgrounds, schools, dog parks/pet relief, rooftops, developers/builders and property managers.

14 Implement structured data around one consistent entity

Machine-readable consistency helps search engines and retrieval systems connect the company, services and locations.

Fix: Use valid LocalBusiness/Organization data, BreadcrumbList, relevant Service markup, Article on guides and appropriate image/project markup. Schema must match visible content exactly.

15 Clean the XML sitemap

A sitemap should reinforce canonical URLs - not advertise redirects, 404s, duplicates or obsolete content.

Fix: Include only indexable, canonical, 200-status URLs. Remove 3xx, 4xx, noindex and duplicate URLs. Submit and validate in Search Console.

16 Verify robots/indexation controls

One accidental block or noindex can neutralize the rest of the SEO work.

Fix: Verify robots.txt, meta robots, X-Robots-Tag, sitemap declaration and crawler access to required JS/CSS. Confirm important pages are indexable in Search Console.

PRIORITY 3

Canonical, content and performance controls

17 Self-canonicalize every valid page

Canonical tags should reinforce the exact final URL after host and slash normalization.

Fix: One canonical tag per indexable page, pointing to its final HTTPS/www URL. Never canonicalize a unique service page to Home.

18 Make titles and meta descriptions unique by search intent

Generic/reused titles waste relevance and make legacy pages harder to distinguish.

Fix: Every core service/location page gets a unique title, H1 and description aligned to the exact customer intent. Avoid repeating the same "Artificial Turf Installation Houston" title.

19 Build deliberate internal linking

Authority should flow from Home -> service hubs -> specialties -> cities -> projects/resources -> conversion pages.

Fix: Use descriptive anchors, breadcrumbs and contextual links. Keep priority pages within 2-3 clicks of Home. Eliminate orphan pages.

20 Control Core Web Vitals and image weight

This is a highly visual site; oversized imagery and heavy JS can make strong content feel slow and unstable.

Fix: Resize/compress images, use WebP/AVIF where practical, lazy-load below-fold media, preload the hero image, define image dimensions, reduce unused JS and monitor LCP/INP/CLS.

Do not add 50 more pages yet. The near-term upside is in consolidation, crawlability and authority. Fix the plumbing first, then scale content.

Canonical NAP standard

SynTurf Installation

3903 Bellaire Blvd, STE E, Houston, TX 77025

832-460-7174

<https://www.synturfinstallation.com/>

Use this exact identity consistently across the site and major citation sources. Avoid unnecessary variations in business naming unless required by a platform or legal record.

Immediate redirect map

```
http://synturfinstallation.com/* -> https://www.synturfinstallation.com/*
https://synturfinstallation.com/* -> https://www.synturfinstallation.com/*

/putting-greens -> /putting-green-installation/
/repair -> correct SynTurf Care repair URL
/install -> closest relevant installation page
/warranty -> /warranty/
/balcony-rooftop-design-houston/ -> rebuild uniquely OR 301 to chosen hub
/join-our-installation-team/ -> current recruiting page OR retire
/artificial-foliage -> current relevant page OR retire
```

Rule: One-hop redirects only. Do not redirect unrelated dead URLs to Home.

Execution sequence

This is the order I would give the development/SEO team. Do not jump ahead to backlink campaigns while the high-priority technical issues remain.

1	404 + redirect cleanup Export 404s, 3xx and indexed legacy URLs. Create the mapping. Remove redirect chains and update internal links to the final destination.
2	NAP + entity cleanup Remove old phone/address/brand references onsite, then clean the major external citations and Google Business Profile consistency.
3	Rendering + indexation Make every money page expose its actual substantive content in crawlable HTML. Validate representative URLs in Search Console.
4	Canonical domain + URL normalization Force HTTPS/www and one slash convention. Add self-referencing canonicals. Update sitemap and internal links.
5	Rebuild top service pages Commercial, Residential, Rooftop, Balcony and Putting Green first. Each should fully answer the buyer's decision.
6	Upgrade local authority Deepen the best revenue-producing location pages with local proof and unique information rather than duplicating templates.
7	Projects + Resources Publish first-party case studies and technical guides that competitors cannot cheaply copy. This is the strongest long-term AI/search authority engine.
8	Schema + performance + ongoing QA Validate structured data, Core Web Vitals, sitemap health, indexed pages, internal links and Search Console coverage on an ongoing basis.

Definition of done

☐ 0 broken internal links	☐ 0 important unresolved 404s
☐ 0 redirect chains	☐ 0 legacy NAP references
☐ 0 duplicate homepage/service URLs	☐ 1 canonical domain
☐ 1 canonical URL per search intent	☐ 1 consistent business entity
☐ 100% sitemap URLs return 200	☐ 100% money pages crawlable/indexable
☐ Priority pages within 2-3 clicks of Home	☐ GSC shows no avoidable indexation conflicts
